FOUNDATION GROUP DESIGNS

ACKNOWLEDGEMENTS

Landscape Innovations Inc. was the subconsultant firm for the West Vancouver Heritage Landscape Inventory; Shan Ripon and Elisabeth Whitelaw were the personnel responsible for all field work and research

The principals in charge of the project were Valda Vidners and Don Luxton of Foundation Group Designs.

Our special thanks are due to Richard Wagner, Social Planner for the District of West Vancouver, for his invaluable support and assistance throughout this project.

The West Vancouver Interim Heritage Advisory Committee, as a group and individually, has also been most helpful, and we wish to thank all members for their participation.

Many thanks are also due to Marilyn Middlemass, Research Assistant/ Secretary of Social Planning, for her organizational assistance and many helpful suggestions.

Thanks also to Miklos Baranszky-Job and the West Vancouver Parks Department for their assistance.

Heinz Berger, Parks Department Manager (Retired), has been of invaluable assistance for his recollections of the years of his tenure, and has provided much background information.

Rupert Harrison, West Vancouver Municipal Archivist, has also generously lent his assistance to the research phase of this project.

Our thanks to Randy Stoltmann, who has personally provided background information and material that was of great assistance during the course of this project.

Stephen Sinclair, Landscape Architect, has lent generously of his time in providing information and assistance.

Our thanks are also due to:

Harry Webb, Landscape Architect. Philip Tattersfield, Landscape Architect. Elaine Graham, of Lighthouse Park

We would also like to thank the individual owners of the properties listed, who kindly allowed us to include their special trees in the inventory.

This project was financially assisted by the Government of British Columbia through the British Columbia Heritage Trust. Additional funding was provided through the Corporation of the District of West Vancouver.

APPENDIX A: SOURCES OF RESEARCH INFORMATION

APPENDIX B: BIBLIOGRAPHY

INTRODUCTION

The rich and varied character of West Vancouver is a result of the unique landforms and distinctive plantings that may be found within the District.

There are some very special trees, both native and introduced, that warrant our particular attention. West Vancouver is indeed fortunate in having many old and record specimens, and some of the finest remaining stands of large virgin trees in the Lower Mainland.

Trees are a growing and tangible link with the past, as their lifespan often exceeds that of other living things. For this reason trees are sometimes planted to commemorate a civic event, as shown by several of these inventoried sites.

Botanically interesting trees also enrich the community through their exotic appeal, and should be respected as part of an overall heritage landscape. Prime specimens of native trees also allow us to understand some of the natural forces that shape our environment.

The following resources were included in the inventory:

- 19 Individual specimens
- 3 Groups of Street Trees
- 5 Parks
- 1 Golf Course

This inventory attempts to compile a record of the historic landscape features in West Vancouver that have historical, botanical and landscape merit in the community.

Inventory Methodology:

The Heritage Landscape Inventory has been undertaken as part of the West Vancouver Heritage Inventory Project. It was initiated with two main goals:

- 1. To conduct a broadly-based survey of the landscape resources of the District, based on a visual survey and on previous research.
- 2. To survey inventoried buildings in order to determine if any had important period plantings that augmented the character of their sites.

The landscape resources were first surveyed as part of the overall windshield survey of the District. A number of sites were chosen for further study; further sites were isolated through previously-prepared lists of heritage resources. Designated heritage walks were surveyed for other possible sites; public nominations also yielded further information. Background research was then conducted through the sources listed in Appendix A of this report. Finally, owners were contacted to ensure that they had no objection to their landscape resources being included.

Individually surveyed buildings were all assessed as to their setting and any associated landscape features. This more general information is contained within the main body of the inventory. Several sites were chosen for further study, however, and have been cross-referenced back to the main inventory master document. Landscape and setting were part of the contextual criteria used for the evaluation of the inventoried buildings.

Once the landscape sites had been chosen, field work, including documentary photographs, was undertaken for each resource. The measurements given for height and width were estimated, and are approximate only, while the D.B.H. (Diameter at Breast Height) could be reached, and was measured. Inventory forms were then prepared for each site, including full descriptions and research information. All background material on each site was then placed in individual files, which have been deposited with the District, along with additional photographs, and catalogued negatives.

This report is a compilation of the individual inventory forms completed for each site.

Conclusions and Recommendations

This inventory is not definitive; it was not possible within the mandate of this project to exhaustively cover all of the important landscape features of the District. It is, however, a comprehensive compilation of previous information, and does include a number of newly identified sites. It will serve as a permanent record for those trees included, and as a base for further research.

It is recommended that the significant landscape resources identified in this inventory, and others identified in the future, be recognized and protected in some form.

Further work also needs to be undertaken on some of the listed sites. Lighthouse Park is an incredibly rich resource, both for its history and its landscape, and it is hoped that a full study could be undertaken of the entire park area. In the way in which Lighthouse Park is a significant natural landscape, the Capilano Golf and Country Club is important as a man-made landscape; further study into its background, design, and current layout should prove most rewarding.

It is anticipated that there are other sites which should be identified and documented. Examples of this would be the Sequoia tree at 1365/1373 Gordon Avenue, and the California Redbud at the rear of 2316 Lawson Avenue, which were brought to our attention but could not be included in the inventory at this time. It is recommended that the inventory be updated, and the situation of the inventoried sites should be monitored on an on-going basis.

There are a number of threats to the security of these important landscape resources, which may be quickly summarized as follows:

- 1. There has traditionally been a conflict between the desire for a park-like setting, and the desire to clear trees away to improve the view. Certain resources should be identified which should not be sacrificed for view considerations. In addition, tree-topping should be discouraged, as it limits the life expectancy of trees and diminishes their form and aesthetic appeal.
- 2. Another major threat is the severe pruning sometimes undertaken to clear the paths of Hydro wires; the trees on 17th Street and on 13th Street have suffered from this treatment.

Specific recommendations and suggestions for heritage resource policy are included in the overall policy suggestions of the main inventory. In general, it is hoped that these valuable landscape resources will be preserved and enhanced, as they are such an important part of the character of West Vancouver.

 Coniferous..X Site Features... Landscape Remnant..X Avenue...
 Area... Residential... Other...
- 3.2 DESCRIPTION: 1,110 years of growth; total age estimated at 1200 years (Stoltmann).

This magnificent tree is one of the oldest and largest in Canada. A native of western North America from Alaska to Oregon, the Yellow Cedar grows from sea level to alpine reaches. At an elevation of 2900 feet this tree has grown slowly through the snow and cold mountain winds to reach its present age of 1200 years.

Yellow cedar is a soft, pale yellow, very fragrant wood that resists rot and insects. It has traditionally been used for carving and is a favourite of boat builders.

The frames for many World War I planes were built with tough, light B.C. yellow cedar. Coastal natives used yellow cedar for canoe paddles and ceremonial masks. Very good condition.

 Park... Landscape/Vista... Evergreen... Deciduous..X Shrub...
 Coniferous... Site Features... Landscape Remnant... Avenue...
 Area... Residential..X Other...
- 3.2 DESCRIPTION: Presumably planted at date of house construction (1939). This specimen has a major trunk with seven main branches, and has the potential to grow to a magnificent specimen tree. These majestic deciduous trees are slow growing and attain great height and spread, being extremely long-lived (up to 800 years). They are a Eurasian and North American representative of White Oak, valued for their timber. In May, the female species flowers in hanging catkins, which produces an oblongish fruit (acorn) that coincides with their dull reddish autumnal leaf colour. The holly hedge surrounding the property and the stone steps enhance the character of the house.

 Good condition.

 Park... Landscape/Vista... Evergreen... Deciduous..X Shrub...
 Coniferous... Site Features... Landscape Remnant... Avenue..X
 Area... Residential... Other...
- 3.2 DESCRIPTION: The Sweetman family planted this tree in 1922 (INV. II). At this time it is the largest known mulberry tree in the Vancouver area. Native to China, and cultivated in other Eastern countries and Southern Europe as the food plant of the silkworm. Foliage is shinier and less downy than the common mulberry. The prolific branching pattern is unique. Flowers are in separate catkins, males in longer spikes than females, which are 1/2" long. Fruits are about 1/2" to 1" long, usually white or pink, although sometimes dark purple; they are blackberry-like in form. The wood is brittle and prone to breakage; Japanese crutches are sometimes needed for support, and these trees are especially susceptible to breakage under heavy snow loads. The planning department was able to convince new owners to retain the tree when the original house was torn down for a gas station. When the gas station was removed for a commercial development, they again persuaded the owners to retain the tree. Good condition; requires some attention. Age 65 years.

- 3.2 DESCRIPTION: Originally grown as an ornamental tree in Europe and North America, this specimen tree creates a pleasing feature at the starting point of the "Village Walk". This is a female tree. Its form is solitary, erect and green, and develops four to seven inch long cones, resembling coconuts, in autumn. It has an unusual low-branching form with a symmetrical branching pattern. Located on the grounds of the Mariner Apartments, it is a remnant from the landscaping of an earlier building. Excellent condition. Age unknown.

- 3.2 DESCRIPTION: This beautiful specimen tree has developed four stems from a single trunk. Native to the coastal region of California and Oregon, it was highly prized for its timber. The highly aromatic foliage is said to induce headaches when inhaled. It flowers in early spring in two to four clusters of ten flowers. The decorative fruits are one inch long, and ripen from yellowish green in August and September. The leaves are smooth and pale green, which fades to yellow or orange before falling in their second season. This tree was planted as a seedling in 1917, and there is another specimen planted in the rear yard.

 Excellent condition. Age 60 years.

- 3.2 DESCRIPTION: These are thought to be the largest-growing trees in the world. They are native to the western slopes of the Sierra Nevada, California, and are cultivated as an ornamental planting in the Eastern United States and in Europe.

This tree was originally planted by Mr and Mrs Frank Jackson in 1923, who brought it as a seedling from Kamloops in a shoe box.

The attractive scale-like foliage has an aniseed-like smell when crushed. Male and female flowers are produced on the same tree. Females produce tiny green conelets, that mature in two years into three inch long cones which may remain on the tree for up to twenty years.

Very good condition. Age 64 years.

3.2 DESCRIPTION: Planted in honour of a visit to West Vancouver in 1935 of Lord Baden Powell and his wife. Plaque at corner of 17th St. and Esquimalt Avenue:

"THESE TREES SPONSORED
BY
CITIZENS OF WEST VANCOUVER
AND PLANTED BY
WEST VANCOUVER BOY SCOUTS
MAY 24 1935"

This double row of 73 chestnut trees is unique to West Vancouver. More than any other ornamental shade tree planting in West Vancouver this avenue of street trees has been the subject of heated debate. While the trees create an historic avenue to the municipal offices, their intrusive roots and leaf litter diminish their positive attributes. The visibly harsh pruning on the east side of the street has resulted in a diminished form, which detracts from the symmetry of the planting. Condition varies from fair to very good. These trees are native to Greece and Albania. The flowers are white, with a yellow patch turning to red on the petal bases, and form clusters up to 12" tall. The fruits have hard spines and split in October to release conkers. May grow to 100 feet tall.

- 3.2 DESCRIPTION: The Copper or European Beech is a tall and well-formed specimen, and its majestic stature and dense shade are among its attributes.
 Native to Europe, it is cutivated for timber, shade and ornament. The edible nuts are a source of oil, which was extracted in Germany during the two World Wars for the production of margarine.
 Flowers open in May with numerous drooping clusters of males, and l or 2 female clusters at the tip of each shoot. The ripe fruit releases triangular nuts in September or October.
 The Old Cedar Grove is part of the remnant landscape, which has

been enhanced by log-top benches with stone footings. Some valuable rare species of rhododendron specimens were acquired

- 3.2 DESCRIPTION: Contrary to popular belief, this is not the tree planted by John Lawson. It is reminiscent, however, of those symbolically important trees, and could be retained as a reminder of the earlier specimens, which were removed when the children's playground was enlarged. John Lawson first settled in Canada in Ontario where it was impossible to grow his favourite tree - the holly. When he was transferred with the railway to Vancouver, he noticed holly trees growing wild near the Agassiz station. He dug them up and planted them in front of his home in Vancouver on Pacific at Burrard. When he later moved to West Vancouver, he transferred the trees to either side of his front door, naming his house on the beach Hollyburn House. In time Lawson gave the name Hollyburn to the Postal Station, which was located in his real estate office. It became the name by which the area between 16th and 19th Streets was known. When the PGE was launched, the Postal Station names were given to the stations: Ambleside, Hollyburn, etc. Fair to good condition.

3.1 TYPE OF RESOURCE: Specimen... Group/Association... Tree...X Deciduous..X Shrub... Landscape/Vista... Evergreen... Coniferous... Site Features... Landscape Remnant... Avenue... Area... Residential... Other...

3.2 DESCRIPTION: Specimen 1: Catalpa Speciosa - The Western Catalpa is a deciduous tree with large heart-shaped leaves. Fragrant white flowers open in June and July. The long brown 'beans' which hang on the tree all winter, making it easy to identify, open in the Spring to release the seeds. The irregular form of this tree is a result of its close proximity to the concession building. Fair condition.

SPECIMEN 2

2.0 IDENTIFICATION: SPECIMEN 2

- 2.1 BOTANICAL NAME: Juglans ailantifolia
- 2.2 COMMON NAME: Japanese Walnut
- 2.3 FAMILY NAME: Juglandaceae, Walnut Family
 2.4 SIZE: Height: 40' 0" D.B.H.: 6' 0" Width: 30' 0"

Specimen 2: Juglans Ailantifolia - Native to Japan, this unusual specimen has a graceful form enhanced by its seaside location. Uncommon to this region, the tree produces male catkins up to twelve inches long, with two inch walnuts. It was planted in the children's playground to keep flies and insects away and provide loosely filtered shade.

The tree was damaged by vandals, and was restored by the municipality. Branches from the top were grafted below and above the cuts. Scars are now barely visible. The tree is smaller than normal due to the stress caused by the bridge graft over the wound. Very good condition.

PHOTOGRAPHIC NEGATIVE NUMBER: Roll L-3: 21 (Bean Tree)

Roll L-3: 22 (Japanese Walnut)

DISTRICT OF WEST VANCOUVER & FOUNDATION GROUP DESIGNS LTD.

SPECIMEN 1

1.0 LOCATION

- 1.1 SITE NUMBER: 26
- 1.2 LOCATION: AMBLESIDE PARK, 13th STREET AND MARINE DRIVE
- 1.3 LEGAL DESCRIPTION: Lot:

Block:

Plan:

DL:

1.4 PRESENT OWNER AND ADDRESS: The Corporation of the District of

West Vancouver,

750 17th Street, West Vancouver, B.C. V7V 3T3

2.0 IDENTIFICATION: SPECIMEN 1

- 2.1 BOTANICAL NAME: Acer platanoides
- 2.2 COMMON NAME: Norway Maple
- 2.3 FAMILY NAME: Aceraceae
- 2.4 SIZE: Height: 30' O" D.B.H.: 5' O" Width: 30' O"

3.1 TYPE OF RESOURCE: Specimen... Group/Association..X Tree..X
Park..X Landscape/Vista... Evergreen... Deciduous..X Shrub...
Coniferous... Site Features... Landscape Remnant... Avenue..X
Area... Residential... Other...

3.2 DESCRIPTION: <u>Specimen 1</u>: Acer Platanoides - The Norway Maple is native to Europe. It is cultivated in parks, streets and shelterbelts in Europe and North America.

Yellow clusters of flowers open in early April. The fruits have horizontal wings which ripen from green to brown, and persist on the tree throughout the winter.

This tree is surrounded by a round stone sitting wall, built by Heinz Berger, retired Parks Manager. This maple is planted on the site of the original Ambleside concession stand and is called the 'Concession Maple'. (See also Jubilee Maple, Site 15)

SPECIMEN 2

2.0 IDENTIFICATION: SPECIMEN 2

- 2.1 BOTANICAL NAME: Acer saaccharinum
- 2.2 COMMON NAME: Silver Maples (5)
- 2.3 FAMILY NAME: Aceraceae
- 2.4 SIZE: Height: 40' O" D.B.H.: 9' O" Width: 26' O"

Specimen 2: Acer Saaccharinum - In conjunction with the Concession Maple there is an existing avenue of five maples, which create a pleasing street canopy over 13th Street, and marks the entrance to Ambleside Park. These are a remnant of the old plans for street trees prior to the 1960's. Continuous pruning has resulted in poor general form for these trees.

Ambleside park was once A garbage dumping ground; now it is an intensively used seaside park. During the Second World War, Ambleside was used as part of the Narrows North military site, including machine gun emplacements, all of which have now been removed. (See West Vancouver Heritage Inventory for more details).

These trees have recently (January 1988) been severely pruned to clear a path for Hydro wires; their form and aesthetic value has been compromised.

3.2 DESCRIPTION:

Specimen 1: These massive trees are exceeded in height only by the California Redwood, and are the largest trees in Canada. Native to North America from Canada south to California, it is cultivated for its timber. Old trees lose the form of a broad sloping pyramid, and develop heavy crooked limbs and a flattened irregular top. The huge upper branches are called 'candelabras' on older trees. These trees were discovered by David Douglas in 1829.

Douglas Firs grow in dense stands on the coast, and are associated with Western Hemlock and Western Cedar; they dominate these smaller trees.

The west end of Lighthouse Park marks the Coastal Douglas Fir bioclimatic zone. It is thought that the Hemlock will replace Douglas Firs, as they cannot adequately transpire in the shade. The cones ripen in the fall, and are 2" - 3" long; the bracts are triple-pronged and easily visible.

This specimen is approximately 400 years old, and is in excellent condition.

4.0 CONTEXT

2.1 BOTANICAL NAME: Thuya plicata
2.2 COMMON NAME: Western Red Cedar

2.3 FAMILY NAME: Thuya, Family Cypressaceae

2.4 SIZE: Height: 190' O" D.B.H.: 23' O" Width: Undetermined

3.0 DESCRIPTION

Specimen 2: Native to Western North America, the cedar was known as the 'Tree of Life' to the West Coast Indians; they used the bark for baskets and clothing, the lightweight wood for houses, cooking boxes, canoes and totem poles, and the roots and branches (withes) for coarse fishnets, lashings and baskets. Due to its resistance to decay, European settlers used this wood for shingles, siding and posts, and it is still valued today as a lumber commodity.

The leaves are scale-like, dark and glossy above, and paler beneath. The distinctive bark is stringy, and the trunk is fluted at the base. The frond-like branchlets impart a feathery appearance to the form. The yellowish-green colour marks this tree from other dark-green evergreens.

These specimens are approximately 200 - 300 years old, and are in very good condition.

2.0 IDENTIFICATION: SPECIMEN 3

2.1 BOTANICAL NAME: Arbutus menziesii/ also adjacent to

Pinus contorta var. latifolia

2.2 COMMON NAME: Arbutus/ adjacent to Lodgepole Pine

2.3 FAMILY NAME: Madrone/ adjacent to Pinaceae

3.0 DESCRIPTION

Specimen 3: An indication of the transition through the valley to the drier site conditions of the Coastal Rocky area. This mixed forest of Lodgepole Pine and Arbutus on a rocky outcrop complements the gnarled and beautiful form of the Arbutus tree. The Arbutus is Canada's only native broad-leafed evergreen; its distinctive mature orange-red bark peels annually in large papery sheets. The thick, leathery, glossy leaves, 3" - 6" long, prevent water from remaining on them, thus protecting themselves from damage to their coating during winter. They flower in May in clusters of creamy white bell-shaped flowers; birds seek the orange-red berries that follow in the late summer. The Lodgepole pine also grows stuntedly along the shoreline here, and the Douglas Fir can perpetuate itself in the shade because the rainfall is lower on this side of the park. Although these may not yet be considered heritage trees, they emphasize the uniqueness of this site's natural features.

- 3.2 DESCRIPTION: The layout of this golf course was one of the first steps in the development of the Capilano Estates, now known as the British Properties. The design of the course was undertaken by Stanley Thompson of Thompson-Jones Co. Golf and Landscape Architects of Toronto. A.J.T. Taylor also hired J.F. Dawson of the famous firm of Olmsted Brothers Landscape Architects of Brookline, Mass. to work with Thompson. The course fairways and greens were completed to the 12th hole by 1935. (INV I) The course was fully open in 1937, although the clubhouse was not completed until the next year. The course was prominently featured in all of the Capilano Estates advertising for many years, and was considered one of the major assets of the development.

This is a very significant designed landscape, connected to well known designers. It espouses a natural approach to design, and takes full advantage of sloping contour, spectacular views, and natural settings. It makes extensive use of native plantings, highlighting its naturalistic feel. The rustic-style "mushroom cap" entry sign is typical of the type of detailing employed by the Olmsted Brothers.

The course was not fully surveyed as part of this Inventory: it is recommended that a comprehensive study and examination could be undertaken in the future, of the extensive features of this site. It may be desirable to mark the overall significance of this site with a plaque, describing both the historical significance of the role of this course in the development of the British Properties, and the special aspects of its landscape.

APPENDIX A: SOURCES OF RESEARCH INFORMATION

Vancouver Public Library:

The Historical Photographs Division was searched for documentary photographs.

West Vancouver Municipal Records:

Information was provided by the Planning Department and the Parks Department regarding previous research data. Rupert Harrison was also an important source of information.

West Vancouver Library:

The Library contains a number of relevant publications on landscape features in West Vancouver.

Private Sources:

A number of individuals provided information about individual resources, the foremost among them being Heinz Berger, Parks Department Manager (Retired). We wish to thank all concerned for their assistance in conducting this project.
